Scaffold Overview

Skaffold = Local Kubernetes Development

Scaffold handles the workflow for building, pushing and deploying your application, allowing you to focus on what matters most: writing code.

<https://scaffold.dev>

Docker Compose and Skaffold

skaifold.yml File

```
apiVersion: skaifold/[version]

kind: Config

metadata:

  name: skaifold-jumpstart

build:

  artifacts:

  - image: nginx-jumpstart

    context: .

    docker:

      dockerfile: Dockerfile

deploy:

  kubectl:

    manifests:

    - .k8s/*.yaml
```

◀ Skaifold version

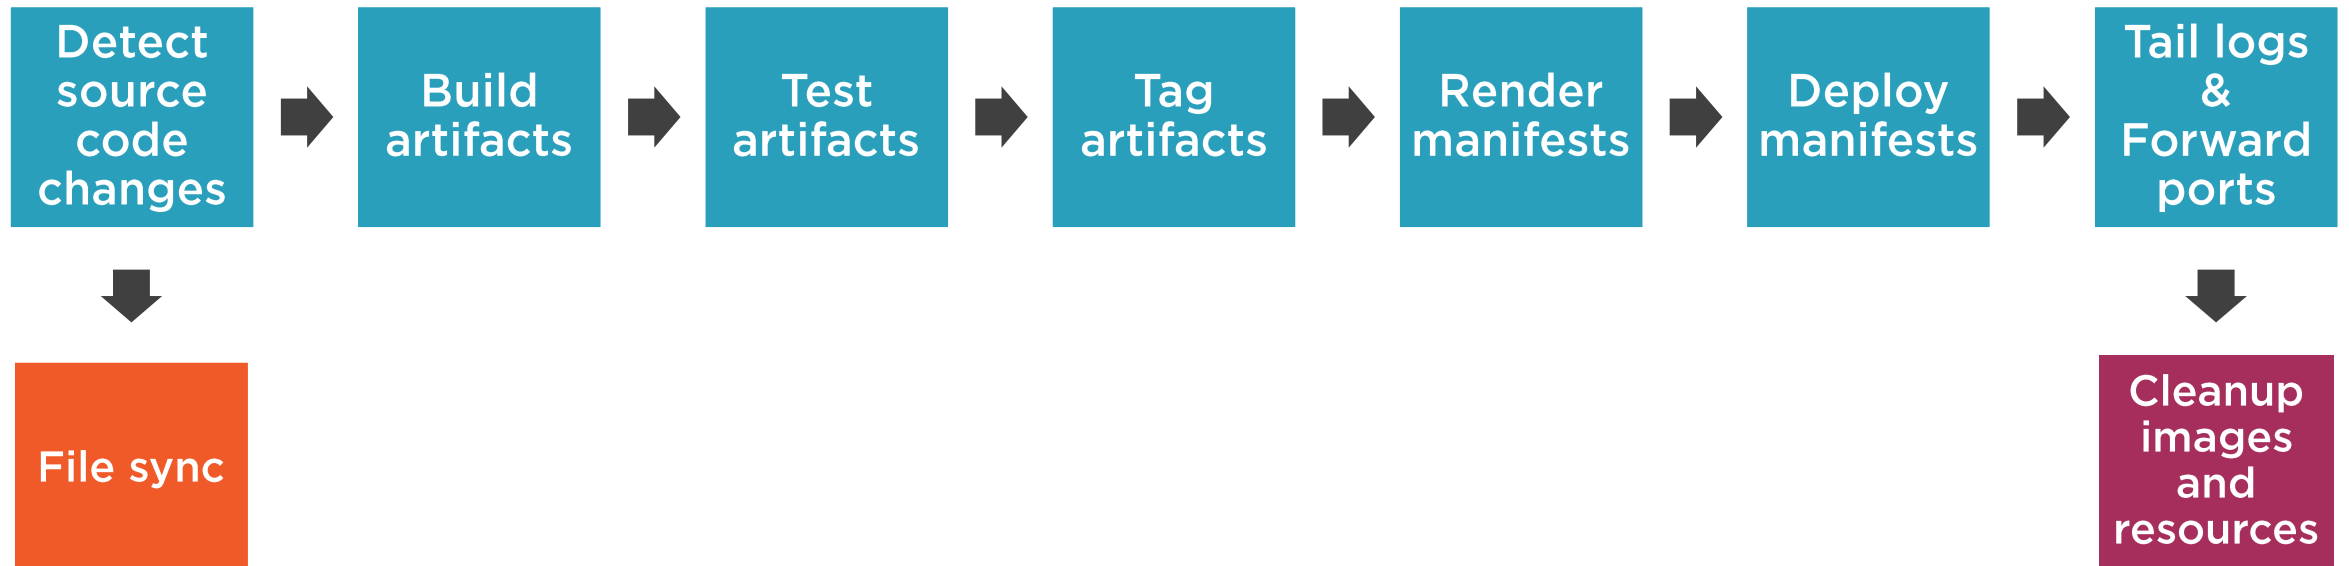

◀ Project artifacts to watch for changes

◀ Dockerfile location for building image

◀ Location of Kubernetes manifest files

Skaffold Pipeline Stages

<https://skaffold.dev/docs/pipeline-stages>

Installing Skaffold

Scaffold Commands

```
# Generate configuration to deploy a project to Kubernetes  
skaffold init
```

```
# Base the configuration on a Docker Compose file  
skaffold init --compose-file docker-compose.yml
```

```
# Define Kubernetes manifest files location  
skaffold init -k .k8s/*.yaml
```

Generating a skaffold.yml file

skaffold init can be used to generate the initial configuration to deploy a project to Kubernetes.

Provides flags to reference a Docker Compose YAML file as a starting point, existing Kubernetes manifest files, and more.

Defining Build Artifacts

--artifact or **-a** can be used to define build artifacts such as the location of your Dockerfiles.

```
# Defining Build Artifacts
skaffold init --compose-file docker-compose.yml \
-a '{"builder":"Docker","payload":{"path":"./nginx.dev.dockerfile"},
  "image":"nginx-jumpstart"}'
```

Generating the skaffold.yml File

```
# Run a build/deployment pipeline in development mode
# Triggers a watch loop build and deploy workflow
skaffold dev
```

```
# Build and deploy project one time
skaffold run
```

Build and Deploy Using Skaffold

skaffold dev can watch your code for changes, build it, and deploy it automatically

skaffold init in Action

Code Sample

<https://github.com/DanWahlin/Angular-JumpStart>

scaffold run in Action

Summary

Scaffold provides a way to convert from Docker Compose to Kubernetes

Uses the Kompose tool under the covers

Can be used to create a development workflow and rebuild images as code changes

Can automatically deploy updated images to Kubernetes
